Subject: Report on International AIDS Day Celebration

Respected Sir,

On 3rd December 2021 on the occasion of “**International AIDS Day**” National Service Scheme (NSS) Department of Institute had organized **Essay Writing & Poster Presentation Competition** for MBA, MCA & B.Voc students of our Institute.

Poster Presentation:

At first, Poster Presentation Competition was conducted in corridor of 2nd floor (Old Library) from 02.00 p.m. to 02.30 p.m. Only one team participated in the competition. Topic for Poster Presentation was “**AIDS Awareness**” The whole event was conducted with great zeal and enthusiasm. **Dr. V.N. Sayankar**, Director, PIRENS IBMA were invited as special guest. **Dr. V.N. Sayankar** enquired the students about the reason behind their creative presentation. He praised the colorful presentation of the girls and for their active participation. Organizers thanked him for his presence which boosted the team and everyone participated with great energy. The event continued for a half hour and at the end **Prof. Renuka Tanpure & Prof. Shradha Bhandari** were invited for judgment. They judged all the teams on different criteria such as Creativity, Demonstration, Cleanliness and Discipline. Finally the team of Miss. Pallavi Mhase & Miss. Sakshi Kolhe stood 1st.

Essay Writing:

An English Essay writing competition was held for the students of MBA, MCA & B.Voc on 3rd December 2021. The students were asked to write on the topic “**AIDS Awareness**”. “The essay was judged on the basis of the student’s vocabulary, presentation and creativity. The purpose of the competition was to encourage the students to enhance their thinking and writing skills. The

Awareness towards AIDS

AIDS: Prevention is the only cure....
It is a disease that is hard to talk about. Acquired Immune Deficiency Syndrome or better known as AIDS is a life-threatening disease. It is one of the most dreaded disease of the 20th century. It is caused by HIV or Human Immunodeficiency Virus, which attacks the immune system of the human body. Due to the continuous efforts of the government and non-government organizations; AIDS awareness has been spread to the masses.

Cause of HIV/AIDS :- The main and only cause of this dreadful disease is the contact through blood, semen, pre-seminal fluid, vaginal fluids, rectal fluids and breast milk. The semen and vaginal fluids are transferred through sex and rectal fluids through anal sex. When people have multiple partners, and they have unprotected sex the transmission is highly likely. Even unsterilized syringes while taking drugs or even a tattoo parlour where they use unsterilized machines on the body can transmit the virus easily. The transmission means are endless so one must proceed with utmost caution to keep themselves safe either way.

Effects of being infected with HIV/AIDS :-

The consequences of HIV are syndromes or symptoms which are categorized as AIDS. The symptoms include fever, nausea, or vomiting and rapid weight loss. Diarrhoea, enlarged lymph nodes in the neck, armpits, and groin for a prolonged duration, recurring fever and night sweats, headache, muscle aches and joint pain. All these symptoms can be very mild and go unnoticed but when it is recurring and severe it is definitely a point of concern. In the initial stages after sixty days the symptoms might disappear and again reappear after many months or years and remain. And in the long run, the infected body is susceptible to cancer as well.

In the later stages, personality changes as the person becomes confused, because of blurred vision and trouble focusing, the limbs also become weaker.

A person with such symptoms does not live long.

However, many of these effects are preventable with antiretroviral treatment, which can preserve and repair the immune system.

Prevention :- There is no permanent cure yet for treating HIV/AIDS, so it is our responsibility to look out for ourselves. The way one can first prevent themselves from being infected is by getting vaccinated. It is important to get tested in your adult life if you have multiple sexual partners and also get your partners tested for the same. The other way is being monogamous. The most used form of prevention is having protected and safe intercourse, which creates a barrier for transmission.

Do check for sterilized needles in case you decide to get a tattoo or injected.

Lessen the use of alcohol and drugs as that is anyway weakening and altering the immune system.

Better to protect, rather than regret. It's clear that prevention will never be sufficient. That's why we need a vaccine that will be safe.

Nonetheless, world AIDS day is celebrated every year on 1st December to spread awareness about the disease and to educate people about the HIV virus.

"Prevention is better than cure, especially when something has no cure"....

Conclusion :- According to the estimates of the Indian government 2.40 million Indians are living with HIV wherein, the infected ones fall in the age group of 15-49 and 39% of them that is 9,30,00 of them are women. The numbers are alarming and the rate of increase is not slowing down anytime soon.

We as a country must break the tradition and conversations about sex should be open and safe. It is high time we lose our lives to this disease which can be prevented.

"Only protection to AIDS is awareness"

"Better to protect, rather than regret"

AIDS AWARENESS

There are some diseases that have been borne by the living in this world which has created a ruckus in human history and the struggle to find a permanent cure still exists. AIDS is one such disease. Acquired Immunodeficiency syndrome is the name of the disease which is also shortened as AIDS.

It has since only the 20th century has affected the human race and many people lost their lives more than 20 million of them. The virus that aids in the transmission of this disease is Human immunodeficiency Virus or also called HIV. Due to the same property of immunodeficiency, it is referred to as HIV/AIDS.

Since it affects the immune system severely, the cells and the workings of it in our body must be clearly understood. The immune system's role in the body is that of a soldier wherein it identifies any sort of anomalies that enters or infiltrates the body and prepares antibodies against it. And kills them in order to prevent infection that has the probability of causing a harmful disease.

Since the cells of the immune system have already created the antibodies, the cell memory is activated when the entry occurs again and the immune system fights and destroys such foreign and harmful matter.

What Happens When HIV Enters the Body?

When a person is infected with the Human immunodeficiency virus, it directly attacks the immune system making the cells weak and incapable of creating

antibodies for this particular virus. As they become the task of defending against other microorganisms entrants is also weakend.

When the fighter in our bodies becomes weak, we are more likely to fall it ill. The illness can be a simple flu or an allergy and our body cannot fight any further. The symptoms once infected will start to appear within the first two weeks. The symptoms are very flu-like for instance, one will be more tired than usual and fatigue will be more frequent and regular. Other symptoms include sore throat and fever. The risk of opportunistic infections like tuberculosis and harpen also increases. Some people however remain asymptomatic even for longer periods after being infected with the virus.

Causes of HIV/AIDS:

The maine and only cause of this dreadful disease is the contact through blood, semen, pre-seminal fluid, vaginal fluids, rectal fluids and breast milk. The semen and vaginal fluids are transferred through sex and rectal fluids through anal sex. When people have multiple partners, and they have unprotected transmission is highly likely. The contact through blood can also be via the unhygienic practic of sharing an infected person's razors, blades. Even unsterilized syringes while taking druges or even a tattoo parlour where they use unsterilized machines on the body can transmit the virus easily. The transmission means are endless so one must proceed with utmost caution to keep themselves safe either way.

Effects of Being Infected with HIV/AIDS:

The consequences of HIV are syndromes or symptoms which are categorized as AIDS. The Belly Cramps, nausea, or vomiting and rapid weight loss. Diarrhoea. Enlarged lymph nodes in the neck, armpits, and groin for a prolonged duration, recurring fever and night sweats, headache, muscle aches and joint pain. All these symptoms can be very mild and go unnoticed but when it is recurring and severe it is definitely a point of concern. In the initial stages after sixty days the symptoms might disappear and again reappear after many months or years and remain. And in the long run, the infected body is susceptible to cancer as well. In the later stages, personality changes as the person becomes confused, because of blurred vision and trouble focusing, the limbs also become weaker.

Some symptoms are visible even in newborn babies and that is the case when the disease is transferred from an already weak immune system so the illnesses remain.

A person with such symptoms does not live long.

Myths:

There are a few myths surrounding this disease. It is believed earlier that AIDS can spread even through contact or touch without any exchange of fluids. Like through a hug or just by being near the infected person. That myth has been debunked and it is absolutely untrue. One can freely hug an AIDS patient without worry.

The other one was when kissing, there is an exchange of saliva which is also a fluid and

that is fatal was another rumor or myth, and this myth is proven wrong where many people have lived longer with HIV by medication and taking care of their health.

Prevention :

There is no permanent cure yet for treating HIV/AIDS. So it is our responsibility to look out for ourselves. The way one can first prevent themselves from being infected is by getting vaccinated. It is important to get tested in our adult and also get your partner tested for the same. The other way is being protected. Do check for sterilized needles in case you decide to get a tattoo or injected. Lessen the use of alcohol and drugs as that is anyway weakening and altering the immune system.

Conclusion :

According to the estimates of the Indian government 2.40 million Indians are living with HIV wherein, the infected ones fall in the age group of 15-49 and 39% of them that is 9,30,00 of them are women. The numbers are alarming and the rate of increase is not slowing down anytime soon. We as a country must break the traditions and conversations about sex should be open and safe. It is high time we lose our lives to this disease which can be prevented.
